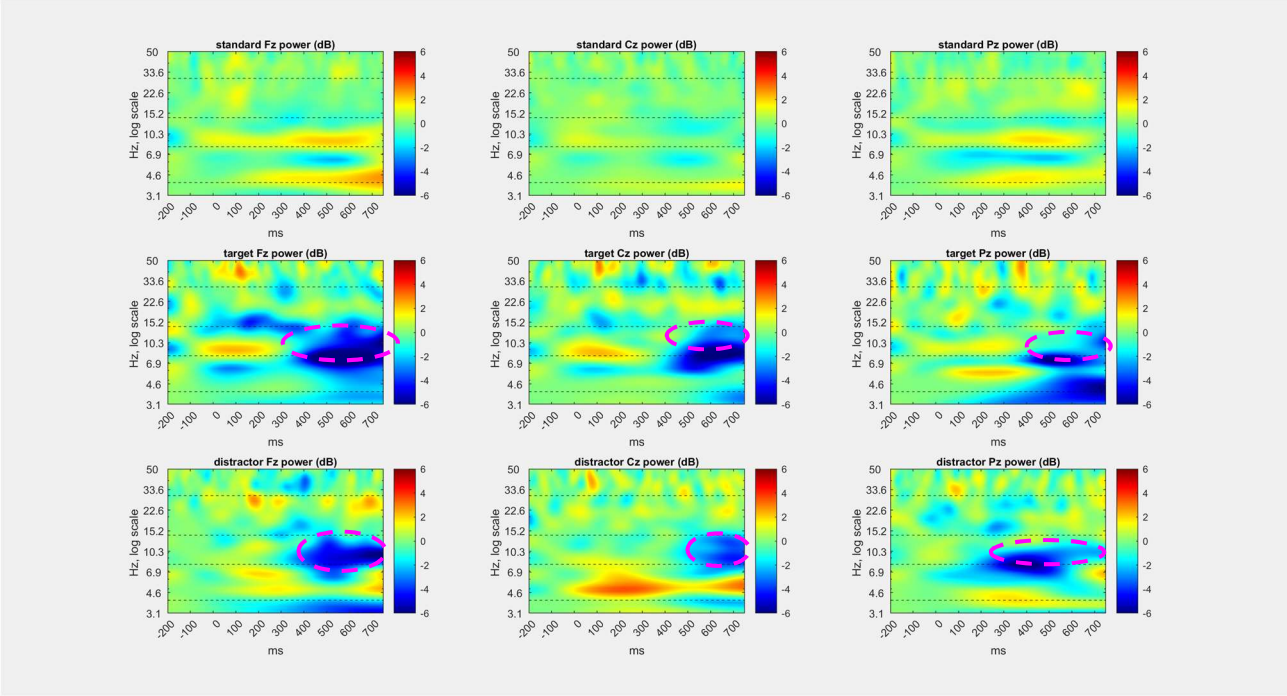
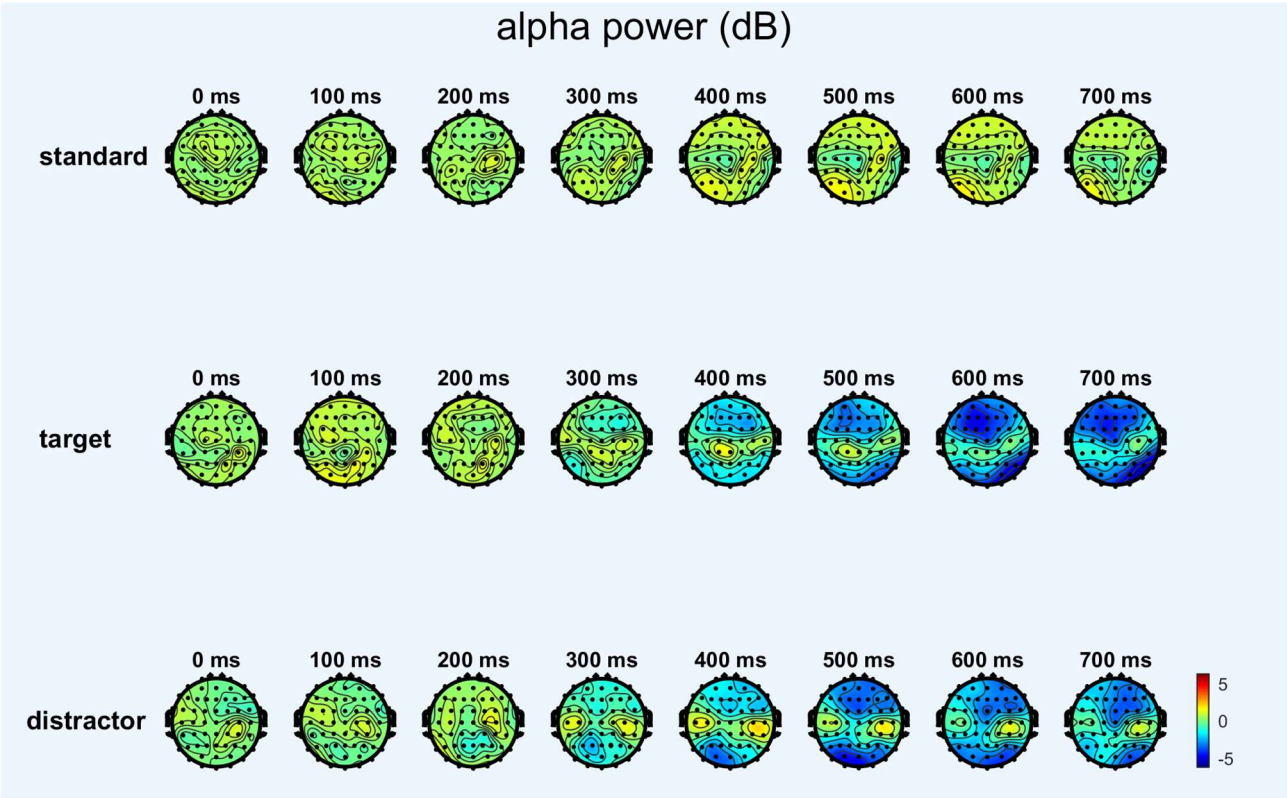
COMMENTS TO FIGURES

EXERCISE 9a - Subject 035

7) Wavelet time-frequency representation of three channels in each condition. A decrease (desynchronization) in alpha band (8-14 Hz) is evident from about 300 ms (blue color) in the target condition slightly more than in the distractor condition, especially at Fz and Cz. Alpha band decrease indicates attention allocation.

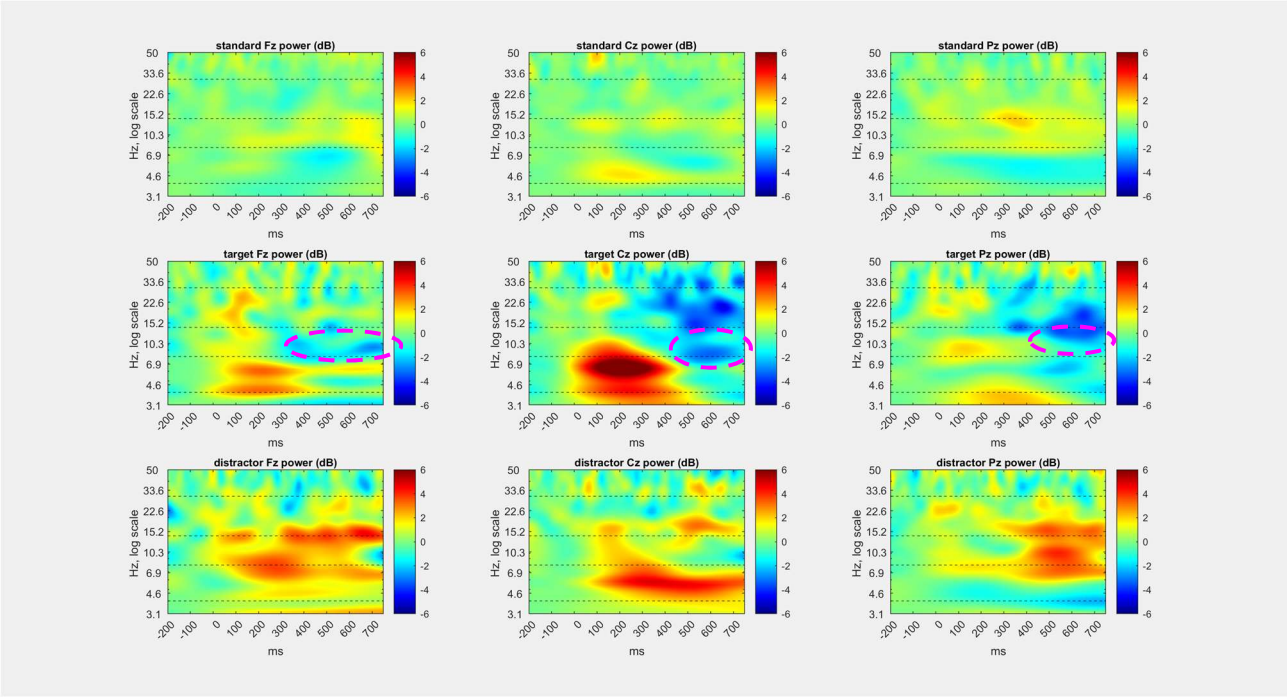


8) Topological maps of alpha band power. Alpha decrease (blue color) is evident at parietal and fronto-central regions slightly more in the target than in the distractor condition

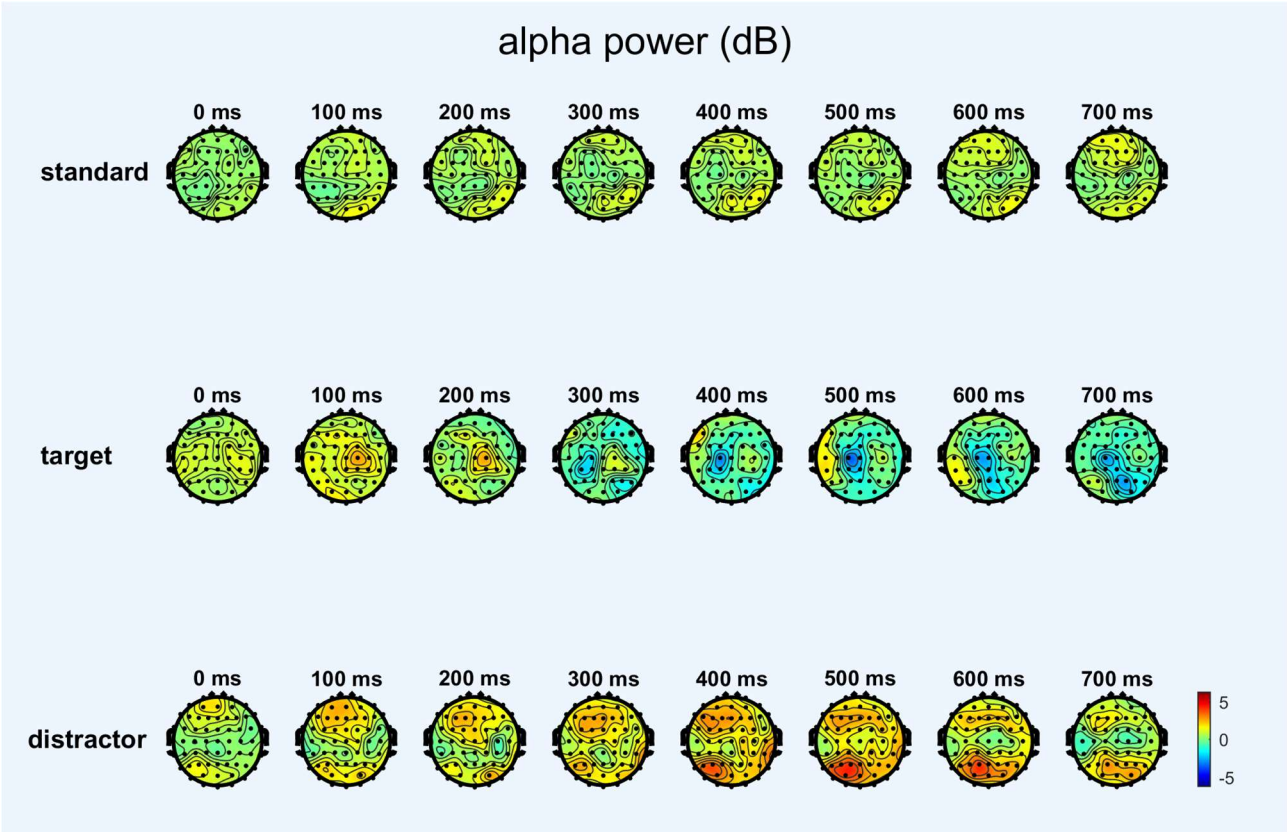


EXERCISE 9a - Subject 003

7) Wavelet time-frequency representation of three channels in each condition. A decrease (desynchronization) in alpha band (8-14 Hz) is evident from about 400 ms (blue color) only in the target condition.

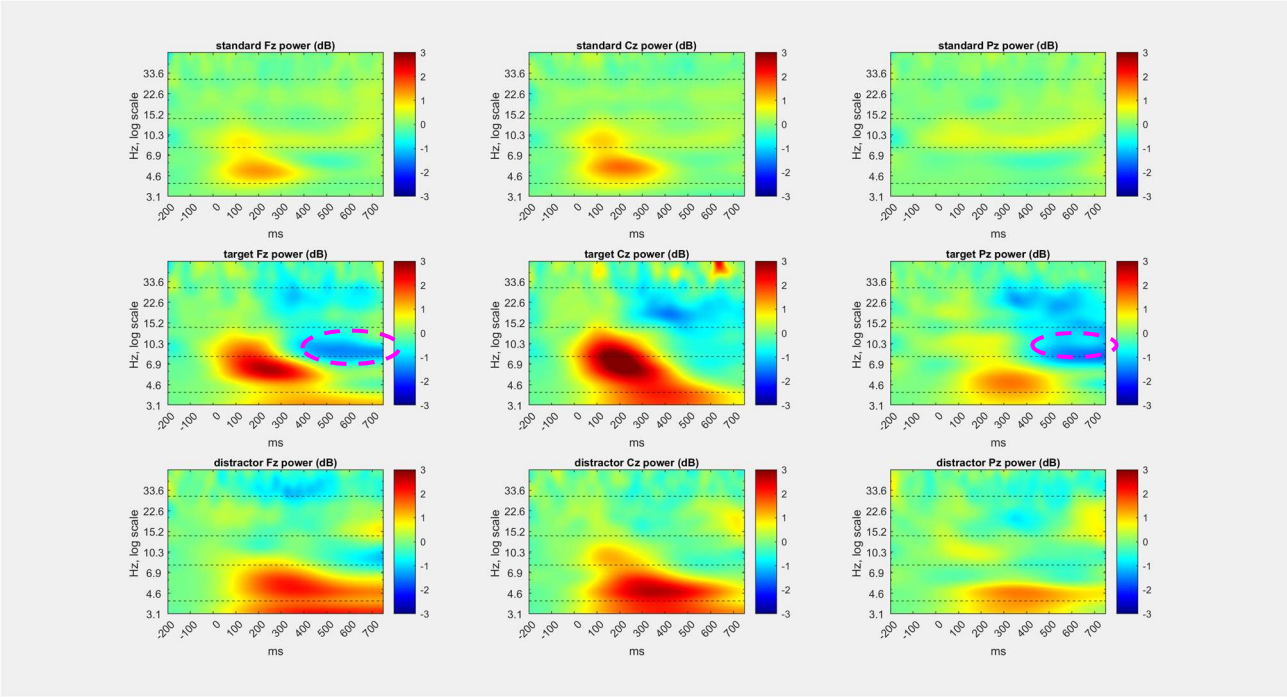


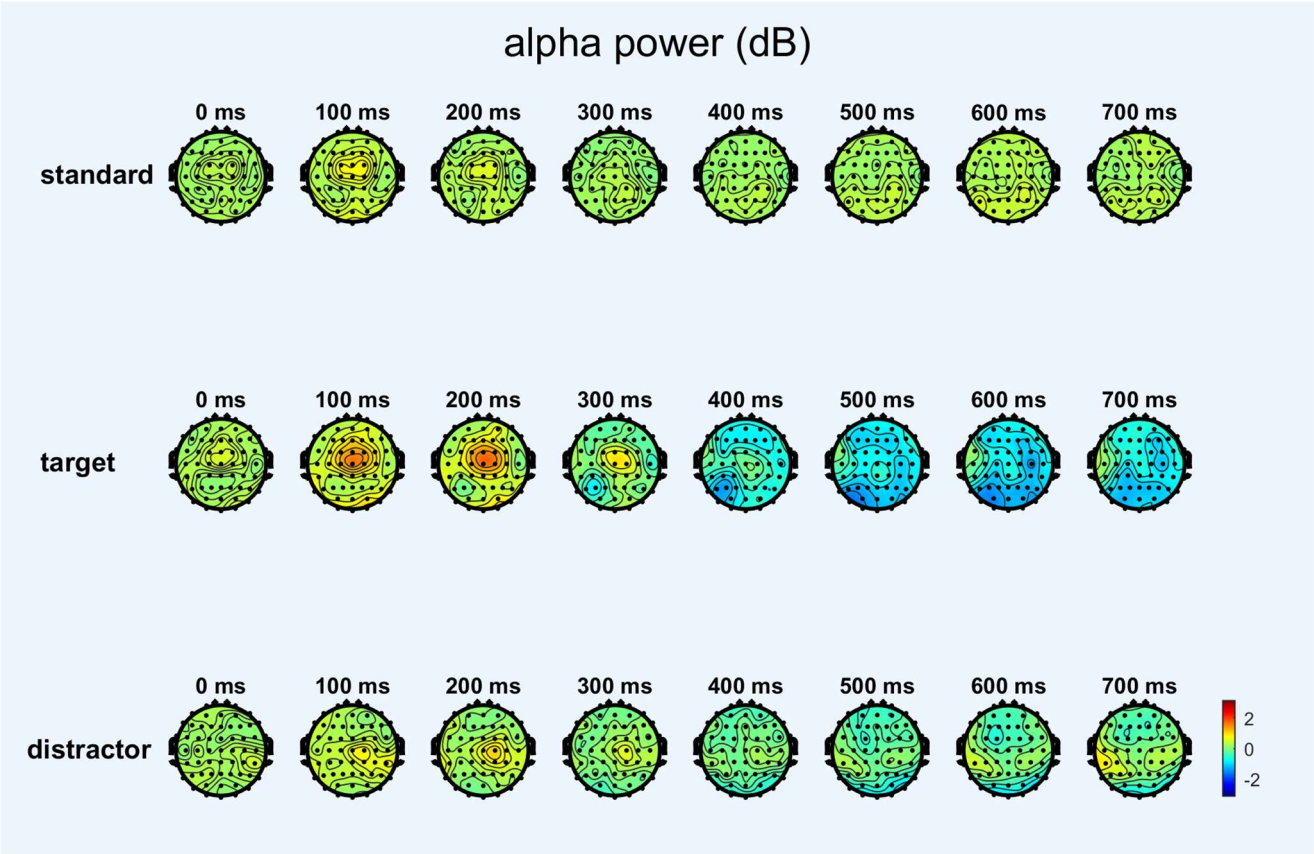
8) Topological maps of alpha band. Alpha decrease (light blue color) is recognizable in some central/parietal regions in case of the target condition.



EXERCISE 9b

2) Wavelet time-frequency representation of three channels in each condition, across all subjects. A decrease (desynchronization) in alpha band (8-14 Hz) is evident from about 400 ms (blue color) only in the target condition, at frontal and parietal electrodes.





3) Topological maps of alpha band. Alpha decrease (light blue color) is recognizable especially in parietal-posterior regions only in the target condition
