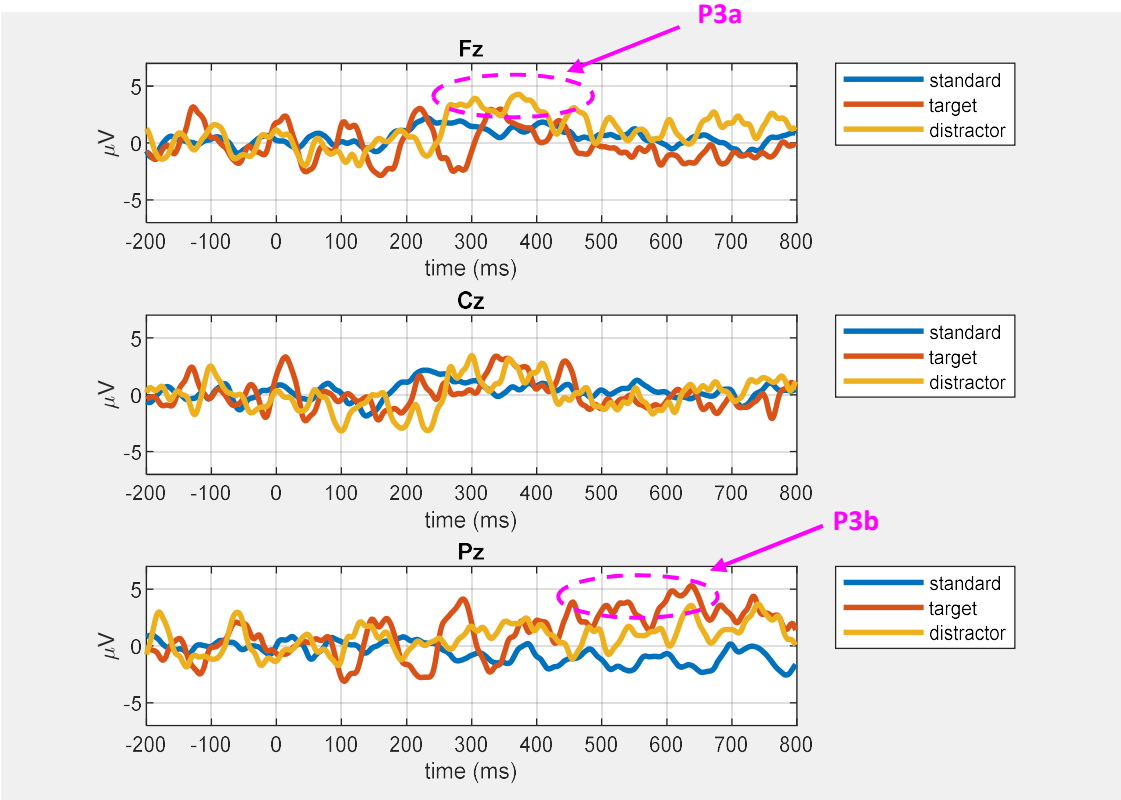
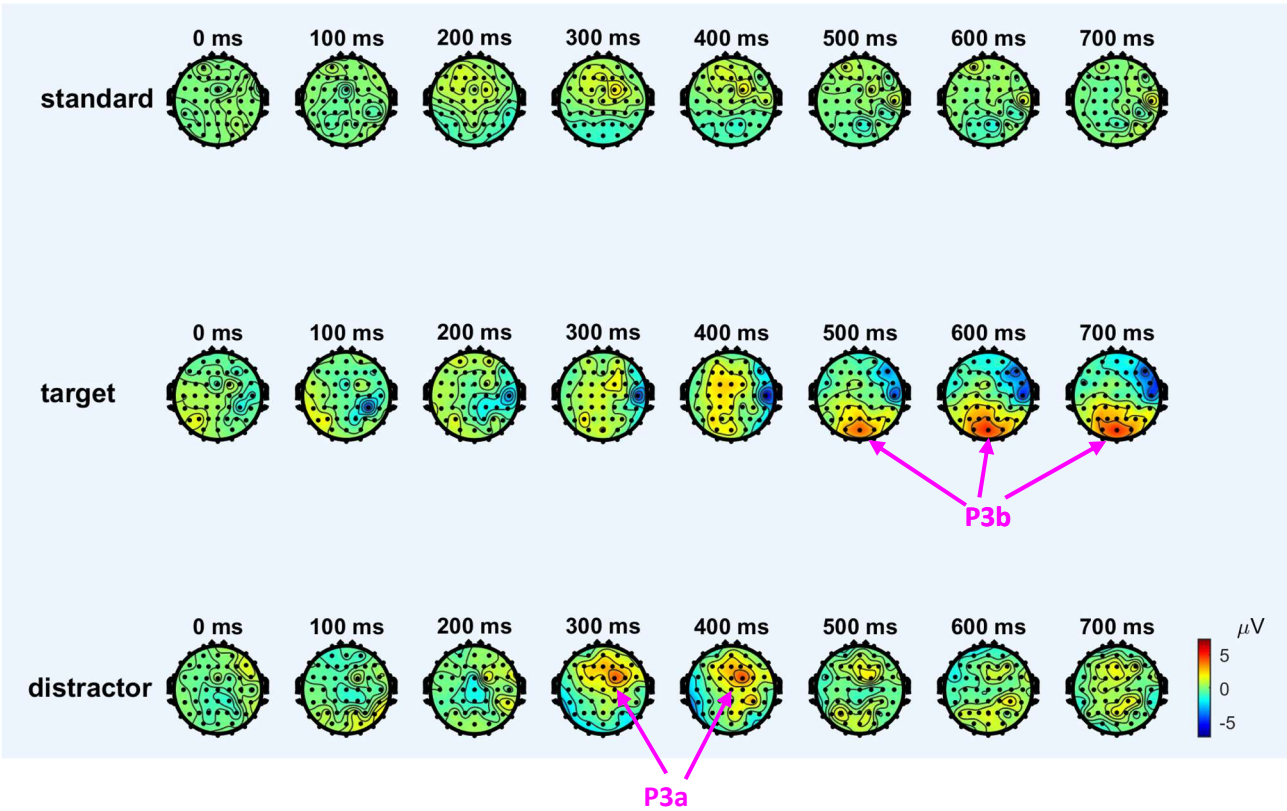
COMMENTS TO FIGURES

EXERCISE 8a - Subject 035

5) Within-subject averages (ERP at single subject level) at three channels for each stimulus condition. In this subject, P3a and P3b are not too evident in this representation, but differences can be observed. In particular, at the parietal electrode Pz we can observe a later increase (between approx. 450-700 ms) not observable at the frontal and central electrodes.

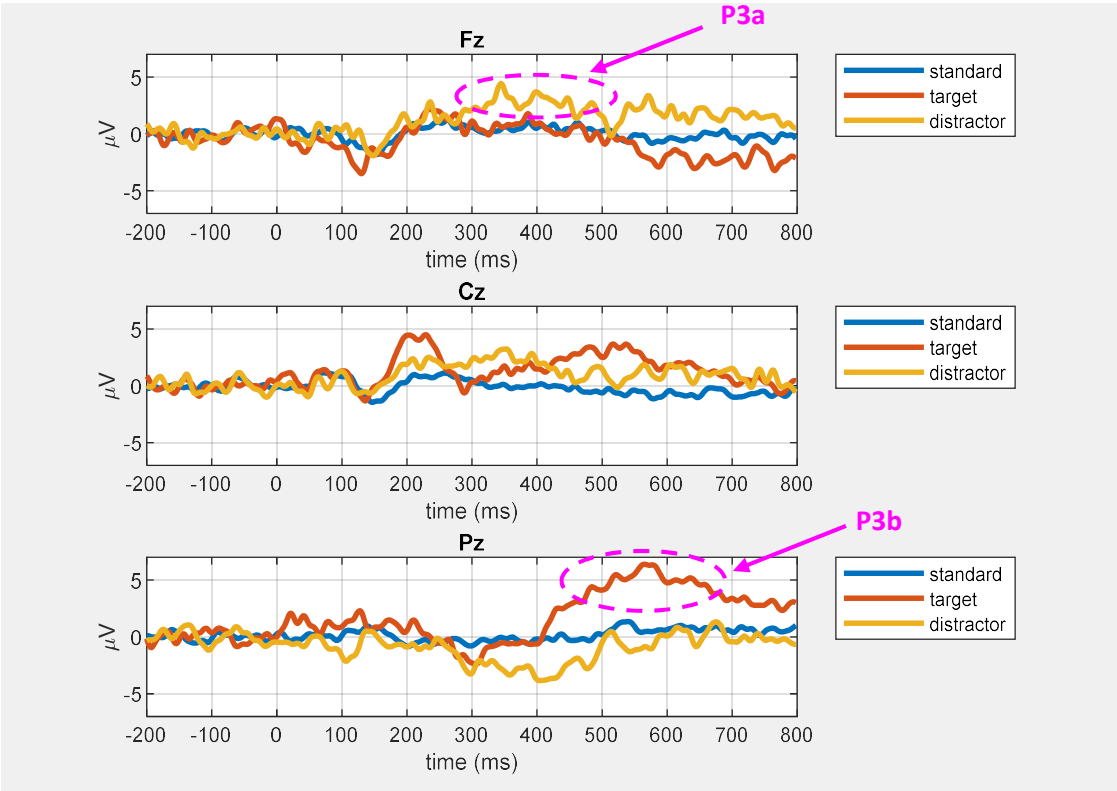


6) Topological maps of the within-subject averages. Differences between the three conditions are more evident

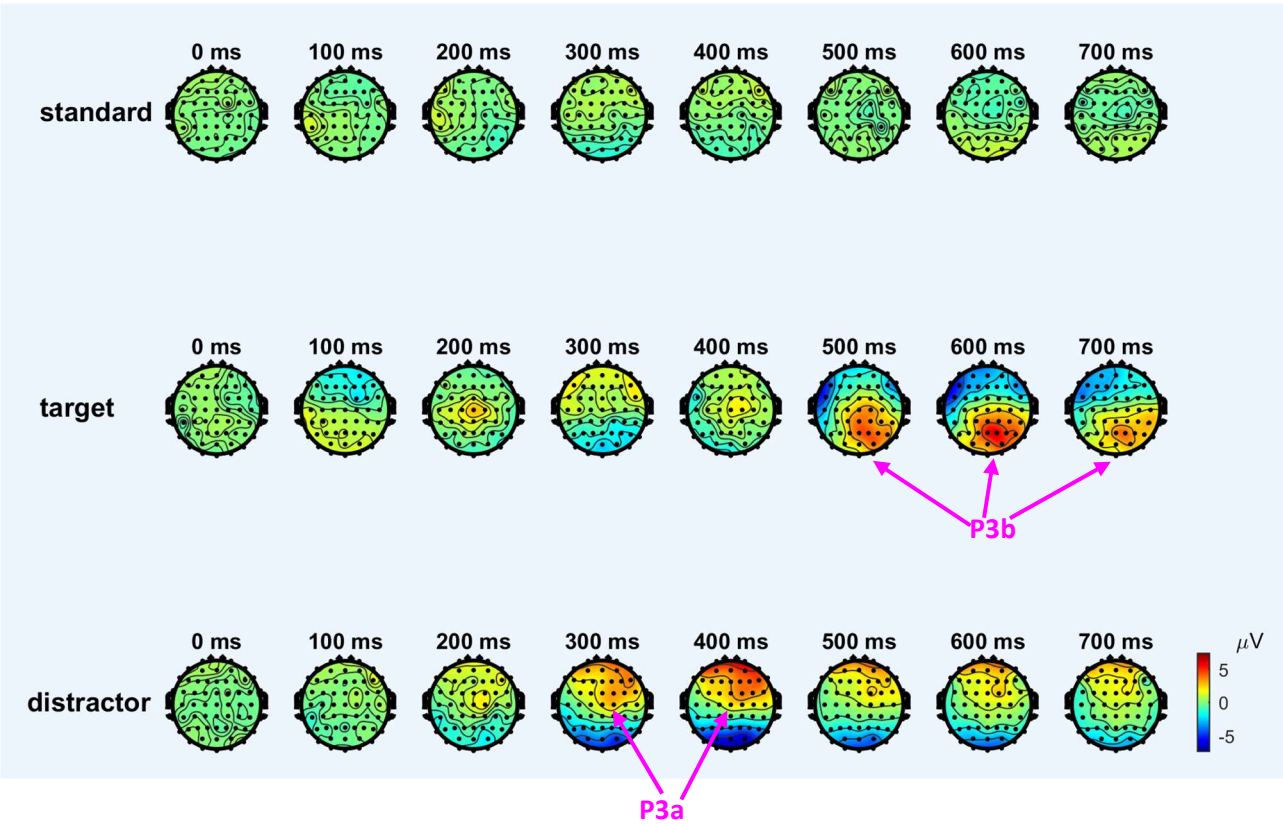


EXERCISE 8a - Subject 003

5) Within-subject averages (ERP at single subject level) at three channels for each stimulus condition. In this subject, time patterns are smoother compared to subject 035. At the parietal electrode Pz we can observe a later large increase (between approx. 400-750 ms) not (or only a little) observable at the frontal and central electrodes.

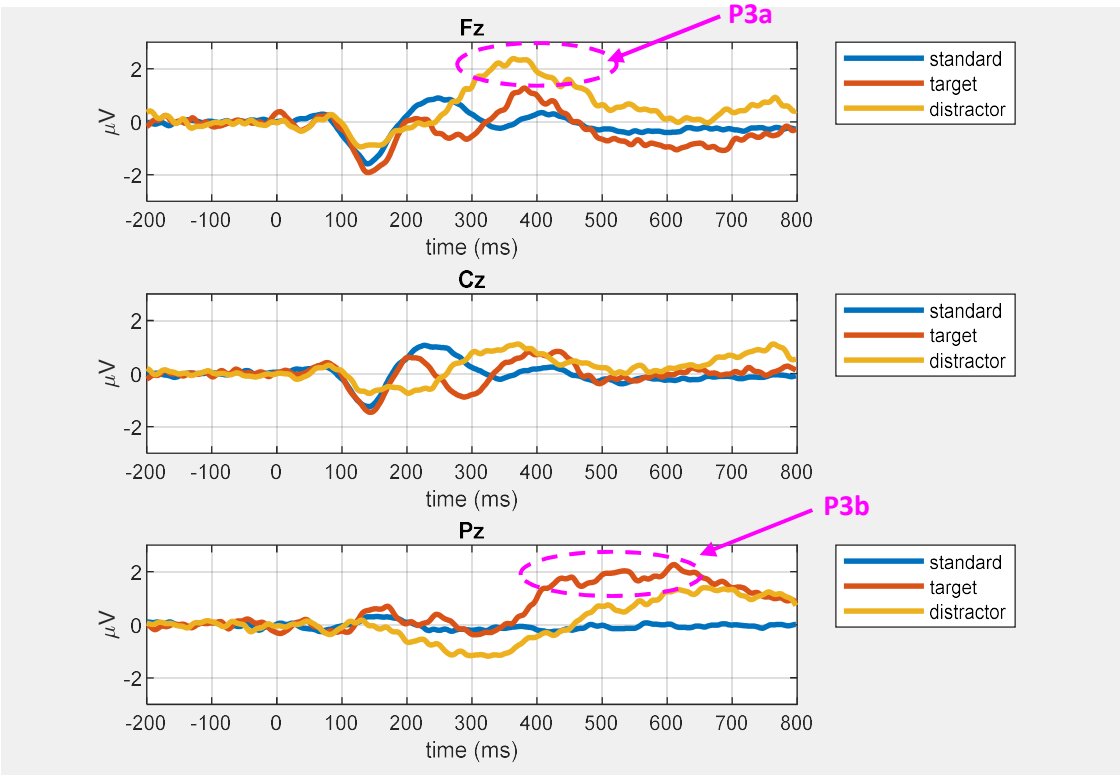


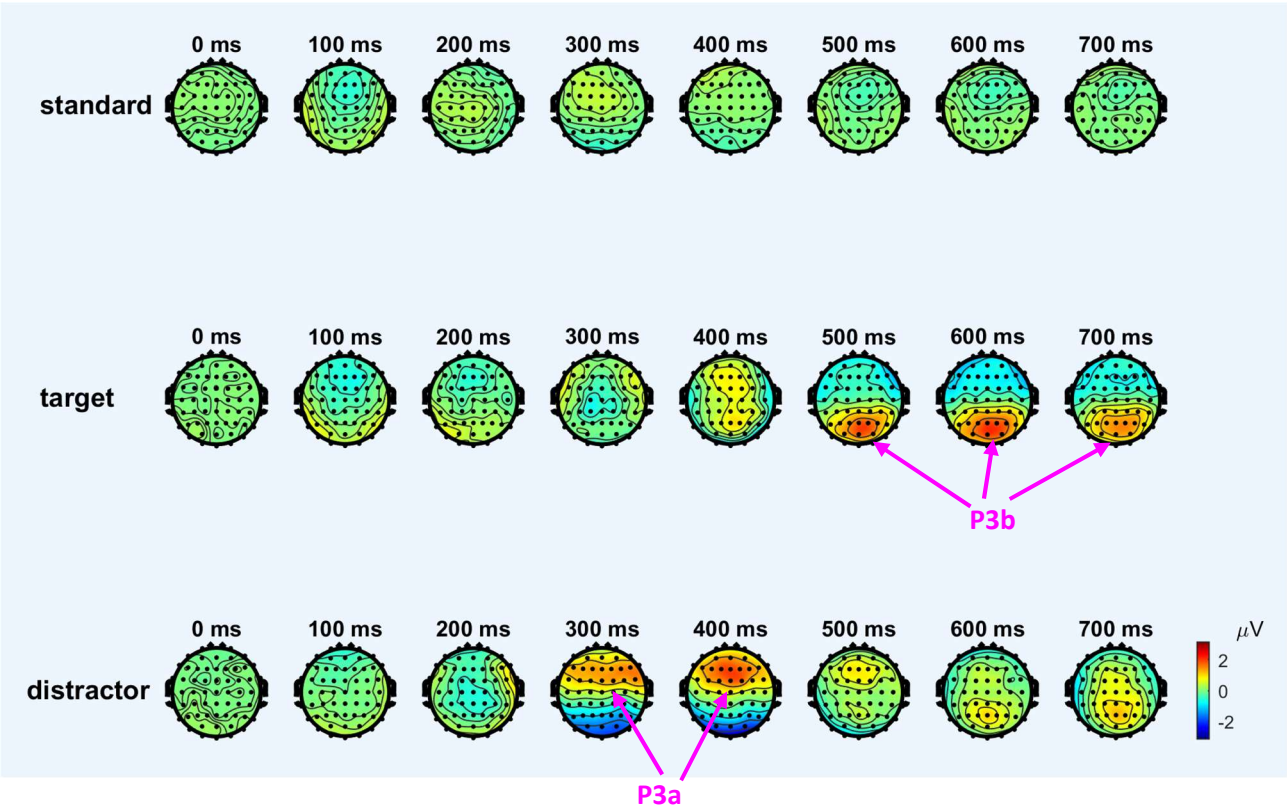
6) Topological maps of the within-subject averages. Differences between the three conditions are evident



EXERCISE 8b

3) Grand average waveforms at the three channels for each stimulus condition. Waveforms are much smoother than in single subjects and capture an average behaviour across subjects.





6) Topological maps of the grand-average. Differences between the three conditions are evident.
